

Science and Technology

Since this is a science class, let's make sure we know what the definition of science is.

Pure science is the study solely for the advancement and increase of knowledge. For example, an entomologist (a scientist who studies insects) discovers that the surface of a moth's eyeball reflects little to no light at all.

Technology is the application of scientific knowledge to solve every day problems and make improvements in the world around us. For example, based on the research on the eyeball of the moth, an optics company develops binoculars that do not reflect light off the surface of the lens.
